The

Product Design Playbook

Ditch guesswork.
Get product-market fit.

What's Inside:

Welcome & Setup

- Introduction
- How leverage the playbook
- Product strategies overview

Product Strategies

1. Onboarding
2. Activation
3. Retention
4. Engagement
5. Growth & Viral
6. Monetisation
7. Conversion Optimisation
8. Experience Refinement
9. Trust Building
10. Intent Shaping
11. Habit Formation
12. Premium Positioning

Modular Plays

1. Commitment
2. Contact Bridge
3. Deep-link
4. Discovery
5. Effort Moat
6. Empty States

Modular Plays

7. Fail Safe
8. Gamified Progress
9. Intent Mirroring
10. Intentional Friction
11. Investment
12. JTBD Copywriting
13. Limited Offer
14. Loading Feedback
15. Micro Interactions
16. Momentum Bias
17. Pattern Alignment
18. Perceived Effort Delay
19. Permission Serve
20. Personalisation
21. Progressive Disclosure
22. Referral
23. Sandbox Experience
24. Setup Defaults
25. Shareability
26. Small Quirk
27. Spark Curiosity
28. Success Moments
29. System Widget
30. The Paywall
31. Time to Value
32. Value Replay
33. Variable Reward

Built for founders & early-stage teams that want to leverage the best design practices to scale their app

Users don’t just remember what your app does. They remember how it feels. This playbook gives you a founding-designer lens to map end-to-end flows that onboard, activate, retain, and monetise.

Turn scattered features into one coherent experience and design moments that deliberately guide behaviour toward measurable outcomes.

Whether you’re chasing PMF or fine-tuning an existing product, it’s your edge for making better decisions

Bartek Marzec

@bartek_marzec

Digital experience strategist who has shaped the product landscape for 7+ years. I partner with visionary founders and industry leaders to build digital products that set new standards.

How to use?

Combine, remix, skip. It's a modular system designed to shape itself around your product, your stage, your style. Use what fits, drop what doesn't.

a. Solve larger goals

1. Pick a **"Product Strategy"** that addresses your goal.
2. Gather the individual play cards.
3. Identify which plays could be used in your app.

→ You now have a strategy of how to reach the goal.

b. Audit your product

1. Shuffle the deck, pick a **"🔖 Play"** card at random.
2. Could the product play be used in your app?
3. Use **"Make it Yours"** card to personalise the play.
4. Do this three times to find quick wins.

c. Explore "🔗 Pair with" routes

1. Explore the interlinked **"🔖 Play"** cards.
2. Pick the plays that best support your vision.
3. Create your own combinations, link plays together.

→ There's your holistic product design strategy.

d. Move a metric

1. Start with a metric you want to improve.
2. Use the **"Behind the Data"** card to uncover what's driving the metric.
3. Match your findings to the **"🔖 Play"** cards that address the drop offs.
4. Design the experience, ship, and measure.

→ Did it move the needle? Reflect, apply learnings, loop again.

Product Strategies

Onboarding
Getting new users familiar with the product & achieving first value.

Trust Building
Establishing credibility and user confidence.

Monetisation
Converting free users to paying customers.

Conversion Optimisation
Improving key conversion points throughout the funnel.

Activation
Getting users to experience core value and become active.

Experience Refinement
Adding delight and premium feel to interactions.

Retention
Keeping users engaged and coming back.

Intent Shaping
Guiding user actions to increase commitment and product fit.

Growth & Viral
Turning users into advocates and drivers of organic growth.

Habit Formation
Creating sticky, repeated usage patterns.

Engagement
Increasing user activity and depth of interaction.

Premium Positioning
Making the product feel high-value and sophisticated.

Onboarding

Getting new users familiar with the product & revealing value.

Empty States — Turning blank screens into activation opportunities

Setup Defaults — Instant, semi-automated jumpstarts

Progressive Disclosure — Unravelling of information layers & product complexity

Time to Value — Gap between first touchpoint & experiencing the benefit

Success Moments — Rewarding immediately after completing key action

JTBD Copywriting — Choose words that move users forward

Pattern Alignment — The familiarity of interactions, flows & behaviours

Sandbox Experience — Product access without account creation friction

Personalisation — Designing relevance into the product experience

Momentum Bias — Give users a head start. They'll want to finish

Micro Interactions — Delight moments that make the product feel alive

Supporting Plays

Permission Serve — System-level access to user data or communications

Loading Feedback — Reducing perceived wait time through smart feedback

Gamified Progress — Game mechanics that trigger habit loops and user return

Contact Bridge — Connecting with users' existing networks

Insights & Metrics

Quantify the impact of your onboarding experience.

1. **Activation Rate**
   - Formula: (Users who complete core action ÷ Total signups) × 100
   - What it measures: Percentage of new users who reach first value
   - Why it matters: High activation means your onboarding leads to meaningful engagement. Low activation signals friction, confusion, or a weak first impression.

2. **Time to Value (TTV)**
   - Formula: Average time from signup to first core action
   - What it measures: How quickly users experience product value
   - Why it matters: The faster the TTV, the less drop-off. Speed is retention's friend.

3. **Onboarding Completion Rate**
   - Formula: (Users who finish all onboarding steps / Users who started) × 100
   - What it measures: How many users make it through the onboarding sequence.
   - Why it matters: Completion signals that the flow was clear, motivating, and relevant.

4. **Step-by-Step Drop-off Rate**
   - Formula: (Users who dropped off at step N / Users who reached step N) × 100
   - What it measures: Where users abandon the onboarding flow
   - Why it matters: It reveals exactly the point of friction where users abandon the task.

5. **Day 1/7/30 Retention**
   - Formula: (Users active on day X / Users who signed up X days ago) × 100
   - What it measures: Whether onboarding built enough momentum to bring users back.
   - Why it matters: Retention is the long tail of onboarding. If you get Day 1 wrong, Day 30 doesn't matter.

Behind the Data

Uncover what's really affecting your onboarding

Conversion Funnel Analysis:

- Which steps have highest drop-off?
- What's the correlation between completion speed and retention?
- Do users who skip tutorials have lower activation rates?

Segmentation Analysis:

- Which traffic sources produce best-activating users?
- How does activation vary by device type?
- Do certain user segments need different onboarding flows?

Behavioural Patterns:

- What's the optimal onboarding length?
- Do users convert after a certain event or usage threshold?
- How does time-of-day impact completion rates?

Monetisation

Converting free users to paying customers.

The Paywall — Turn conversion friction into product desire

Intentional Friction — Introduction of purposeful slowdown

Limited Offer — Create urgency at moments of churn or hesitation

Perceived Effort Delay — Increasing perceived value with a timely pause

Success Moments — Rewarding users immediately after a key action

Time to Value — Gap between first touchpoint & experiencing the benefit

Spark Curiosity — Creating tension between the user, product and the outcome

Supporting Plays

Gamified Progress — Game mechanics that trigger habit loops and user return

Effort Moat — Turn invested effort into loyalty by acknowledging it

Investment — Small actions that increase attachment

Personalisation — Designing relevance into the product experience

JTBD Copywriting — Choose words that move users forward

Insights & Metrics

Quantify the impact of your Monetisation efforts.

1. **Free-to-Paid Conversion Rate**
   - Formula: (Paid subscribers / Total free users) × 100
   - What it measures: The percentage of free users who become paying customers.
   - Why it matters: It shows how well your product turns interest into income

2. **Paywall Conversion Rate**
   - Formula: (Users who upgraded / Users who saw paywall) × 100
   - What it measures: Effectiveness of paywall presentation
   - Why it matters: It captures how persuasive your offer is at the decision moment

3. **Average Revenue Per User (ARPU)**
   - Formula: Total revenue / Total active users (free + paid)
   - What it measures: Revenue generated per user over time period
   - Why it matters: Helps you assess the overall monetisation health across your base

4. **Customer Lifetime Value (LTV)**
   - Formula: (ARPU × Gross margin %) / Churn rate
   - What it measures: Total revenue expected from a customer
   - Why it matters: Shows total revenue each customer brings in before they churn

5. **Trial-to-Paid Conversion Rate**
   - Formula: (Trial users who converted / Total trial users) × 100
   - What it measures: How effectively trials drive subscriptions
   - It reflects the strength of your product experience

6. **Churn Rate**
   - Formula: (Customers lost / Total customers at start of period) × 100
   - What it measures: Rate of subscription cancellations
   - Why it matters: Signals how quickly you're losing paying customers over time.

Behind the Data

Understand where value perception breaks, urgency is low, or where users hesitate to pay.

Conversion Funnel Analysis:

- At what point do users hit paywalls most frequently?
- Which premium features drive highest conversion intent?
- How does time-to-paywall affect conversion rates?

Pricing & Packaging Analysis:

- Which pricing tiers have highest conversion rates?
- How does annual vs monthly billing affect LTV?
- What's the optimal trial length for your product?

User Behaviour Patterns:

- Which user actions predict highest conversion likelihood?
- How does usage frequency correlate with willingness to pay?
- What triggers cause users to cancel subscriptions?

Activation

Getting users to experience core value and become active.

Time to Value — Gap between first touchpoint & experiencing the benefit

Success Moments — Rewarding users immediately after a key action

Setup Defaults — Instant, semi-automated jumpstarts

Empty States — Turning blank screens into activation opportunities

Discovery — Users uncover what's possible

Personalisation — Designing relevance into the product experience

Micro Interactions — Delight moments that make the product feel alive

Momentum Bias — Give users a head start. They'll want to finish

Supporting Plays

Progressive Disclosure — Unravelling of information layers & product complexity

JTBD Copywriting — Choose words that move users forward

Loading Feedback — Reducing perceived wait time through smart feedback

Sandbox Experience — Product access without account creation friction

Contact Bridge — Connecting with users' existing networks

Insights & Metrics

Quantify the impact of your activation efforts.

1. **Activation Rate**
   - Formula: (Users who complete core action / Total signups) × 100
   - What it measures: Percentage of new users who reach first value
   - Why it matters: High activation means your onboarding leads to meaningful engagement. Low activation signals friction, confusion, or a weak first impression.

2. **Time to Value (TTV)**
   - Formula: Average time from signup to first core action
   - What it measures: How quickly users experience product value
   - Why it matters: The faster the TTV, the less drop-off. Speed is retention's friend.

3. **Feature Adoption Rate**
   - Formula: (Users who used feature X / Total activated users) × 100
   - What it measures: Uptake of specific core features post-activation
   - Why it matters: Higher adoption correlates with better retention

Behind the Data

What's preventing users from experiencing core value, and what accelerates it.

Activation Pattern Analysis:

- What sequence of actions leads to fastest activation?
- Which features serve as strongest activation predictors?
- How does guided vs self-directed exploration affect activation?

User Journey Optimisation:

- Where do users get stuck before reaching activation?
- Which onboarding elements correlate with activation success?
- How does personalisation level impact activation depth?

Value Discovery Patterns:

- What triggers users' "aha" moments most effectively?
- Which empty states convert best to meaningful actions?
- How does social proof influence activation behaviour?

Retention

Keeping users engaged and coming back.

Gamified Progress — Game mechanics that trigger habit loops and user return

System Widget — Real-time value and connection right from the home screen

Value Replay — Resurface momentum across channels to reinforce value

Effort Moat — Turn invested effort into loyalty by acknowledging it

Personalisation — Designing relevance into the product experience

Variable Reward — Just the right amount of unpredictability

Commitment — Let users declare their intent, then design around it

Supporting Plays

Success Moments — Rewarding immediately after completing key action

Micro Interactions — Delight moments that make the product feel alive

Intent Mirroring — Reflect user behavior in real time to build trust and drive action

Pattern Alignment — The familiarity of interactions, flows & behaviours

Deep-link — Drop users into the exact moment, feature, or context that matters

Insights & Metrics

Quantify the impact of your retention efforts.

1. Day 1/7/30 Retention Rates

- Formula: (Users active on Day X / Install cohort size) × 100
- What it measures: User stickiness over time
- Why it matters: Foundation metric for sustainable growth

2. Stickiness Ratio (DAU/MAU)

- Formula: Daily Active Users / Monthly Active Users
- What it measures: Habit formation and engagement depth
- Why it matters: Higher ratios indicate successful habit formation

3. Streak Length

- Formula: Average consecutive days of app usage
- What it measures: Habit strength and user commitment
- Why it matters: Longer streaks predict long-term retention

Behind the Data

Why users come back, or why they don't.

Retention Curve Analysis:

- What does your retention curve shape indicate about product-market fit?
- Which user cohorts have the flattest (best) retention curves?
- How do seasonal patterns affect long-term retention?

Feature Usage Evolution:

- Which features predict long-term retention vs short-term engagement?
- How does feature adoption sequence impact retention strength?
- What's the optimal feature discovery pace for sustained engagement?

Habit Formation Patterns:

- What triggers transform occasional users into habitual users?
- How does notification strategy impact retention without causing fatigue?
- Which workflows become most "sticky" over time?

Growth & Viral

Turning users into advocates and drivers of organic growth.

Referral — Turn users into advocates by designing sharing right into the product flow

Shareability — Turn moments of pride into organic growth

Contact Bridge — Connecting with users' existing networks

Deep-link — Drop users into the exact moment, feature, or context that matters

Success Moments — Rewarding immediately after completing key action

Supporting Plays

Gamified Progress — Game mechanics that trigger habit loops and user return

Effort Moat — Turn invested effort into loyalty by acknowledging it

Variable Reward — Just the right amount of unpredictability

System Widget — Real-time value and connection right from the home screen

Spark Curiosity — Creating tension between the user, product and the outcome

Insights & Metrics

Quantify the impact of your growth and virality efforts.

1. **Viral Coefficient (K-Factor)**
   - Formula: (Invitations sent per user × Invitation acceptance rate)
   - What it measures: How many new users each existing user brings
   - Why it matters: Indicates if your product grows itself through user sharing

2. **Referral Program ROI**
   - Formula: (Revenue from referred users - Referral costs) / Referral costs × 100
   - What it measures: Financial efficiency of growth investments
   - Why it matters: Helps evaluate if your referral program is profitable

3. **Organic Growth Rate**
   - Formula: (New organic users / Total users) × 100 per time period
   - What it measures: Word-of-mouth and natural discovery growth
   - Why it matters: Tracks the strength of non-paid channels

4. **Network Density Score**
   - Formula: (Connected user pairs / Total possible connections) × 100
   - What it measures: How interconnected your user base is for network effects
   - Why it matters: A denser network boosts retention, collaboration, and virality

5. **Viral Cycle Time**
   - Formula: Average time from user signup to first successful referral
   - What it measures: Speed of viral loop completion
   - Target benchmark: aster cycles drive exponential growth

Behind the Data

What makes users want share, invite, and what's holding that back.

Viral Loop Optimisation:

- Which sharing moments generate highest-quality referrals?
- How does timing of referral prompts affect conversion rates?
- What's the optimal incentive structure for both referrer and referee?

Network Effect Analysis:

- At what network size do users experience significant value increases?
- Which collaborative features drive strongest viral behaviour?
- How does social proof influence referral willingness and success?

Growth Channel Performance:

- Which referral channels have highest lifetime value users?
- How do organic vs incentivised referrals differ in quality?
- What content types achieve highest share-to-conversion rates?

Engagement

Increasing user activity and depth of interaction.

Micro Interactions — Delight moments that make the product feel alive

Gamified Progress — Game mechanics that trigger habit loops and user return

Variable Reward — Just the right amount of unpredictability

Discovery — Users uncover what's possible

Personalisation — Designing relevance into the product experience

Intent Mirroring — Reflect user behavior in real time to build trust and drive action

Supporting Plays

Success Moments — Rewarding immediately after completing key action

System Widget — Real-time value and connection right from the home screen

Loading Feedback — Reducing perceived wait time through smart feedback

Progressive Disclosure — Unravelling of information layers & product complexity

Small Quirk — Unique element that represents your product's character

Insights & Metrics

Quantify the impact of your engagement efforts.

1. Pages/Screens Per Session

- Formula: Total pages or screens viewed / Total sessions
- What it measures: How much users explore during each visit
- Why it matters: Higher exploration suggests deeper curiosity and content relevance

2. Feature Adoption Rate

- Formula: (Users who used feature / Total active users) × 100
- What it measures: How well users discover and adopt product features
- Why it matters:Tracks stickiness and validates which features deliver value

3. Session Duration

- Formula: Average time spent per session
- What it measures: User engagement depth and satisfaction
- Why it matters: Longer sessions typically indicate higher engagement

4. Stickiness Ratio (DAU/MAU)

- Formula: Daily Active Users / Monthly Active Users
- What it measures: Habit formation and engagement depth
- Why it matters: Higher ratios indicate successful habit formation

Behind the Data

Uncover what's keeping users engaged and what's missing from their journey.

Engagement Flow Analysis:

- Which micro-interactions create momentum for deeper engagement?
- How does progressive disclosure impact feature discovery and usage?
- What interaction patterns predict long-term engagement growth?

Discovery Optimisation:

- Which discovery mechanisms lead to highest feature adoption?
- How does personalised vs generic suggestion impact engagement?
- What's the optimal cognitive load for feature exploration?

Interaction Design Effectiveness:

- Which micro-interactions feel most satisfying and encourage continued use?
- How do variable rewards impact engagement consistency?
- What balance of predictability vs surprise optimises engagement?

Trust Building

Establishing credibility and user confidence.

Fail safe — Destructive actions are guarded with increased effort

Pattern Alignment — The familiarity of interactions, flows & behaviours

JTBD Copywriting — Choose words that move users forward

Loading Feedback — Reducing perceived wait time through smart feedback

Perceived Effort Delay — Increasing perceived value with a timely pause

Supporting Plays

Micro Interactions — Delight moments that make the product feel alive

Success Moments — Rewarding immediately after completing key action

Permission Serve — System-level access to user data or communications

Progressive Disclosure — Unravelling of information layers & product complexity

Intentional Friction — Introduction of purposeful slowdown

Insights & Metrics

Quantify the impact of your trust building efforts.

1. **Permission Grant Rate**
- Formula: (Permissions granted / Permission requests) × 100
- What it measures: User trust in granting access to sensitive features/data
- Why it matters: Direct indicator of user trust and comfort with your product

2. **Task Completion Rate (Complex Flows)**
- Formula: (Multi-step tasks completed / Multi-step tasks started) × 100
- What it measures: User confidence in navigating sophisticated workflows
- Why it matters: Completion of advanced flows shows users trust the system and are willing to invest time

3. **Support Ticket Volume (Trust-Related)**
- Formula: (Trust/security/privacy tickets / Total support tickets) × 100
- What it measures: User confusion or concern about safety/security
- Why it matters: High trust-related volume suggests gaps in clarity or confidence in safety

Behind the Data

Uncover why users hesitate and what would make them feel more confident.

Permission Optimisation:

- Which permission requests have lowest grant rates?
- How does timing of permission requests affect acceptance?
- Does providing clear explanations increase grant rates?

Flow Confidence:

- Where do users most commonly abandon complex tasks?
- Which flows benefit most from additional guidance or safety nets?
- How does task complexity correlate with completion rates?

Trust Issues:

- What types of trust/security concerns generate most support tickets?
- How quickly can trust-related issues be resolved?
- Which user segments have highest trust-related support needs?

Conversion Optimisation

Improving key conversion points throughout the funnel.

The Paywall — Turn conversion friction into product desire

Limited Offer — Create urgency at moments of churn or hesitation

Intentional Friction — Introduction of purposeful slowdown

Success Moments — Rewarding immediately after completing key action

Spark Curiosity — Creating tension between the user, product and the outcome

Momentum Bias — Give users a head start. They'll want to finish

Supporting Plays

Time to Value — Gap between first touchpoint & experiencing the benefit

JTBD Copywriting — Choose words that move users forward

Perceived Effort Delay — Increasing perceived value with a timely pause

Personalisation — Designing relevance into the product experience

Insights & Metrics

Quantify the conversion optimisation efforts.

1. **Conversion Rate**
- Formula: (Users who completed target action / Total users in funnel) × 100
- What it measures: Effectiveness of your primary conversion funnel
- Why it matters: Core business metric that directly impacts revenue

2. **Funnel Drop-off Rate**
- Formula: (Users who abandoned at step X / Users who reached step X) × 100
- What it measures: Where users exit your conversion process
- Why it matters: Identifies specific friction points to fix

3. **Average Time to Convert**
- Formula: Average time from first touchpoint to conversion
- What it measures: Length of consideration/decision process
- Why it matters: Helps optimise nurturing and retargeting windows

4. **Conversion Rate by Traffic Source**
- Formula: (Conversions per source / Visits per source) × 100
- What it measures: Channel quality and user intent across acquisition sources
- Why it matters: Shows where to invest marketing budget for best ROI

Behind the Data

Identify where users lose clarity, confidence, or momentum on the path to conversion.

Funnel Optimisation:

- Which steps have highest drop-off rates?
- How does mobile vs desktop conversion performance compare?
- What's the optimal number of steps for your conversion funnel?

Traffic Quality:

- Which sources bring users most likely to convert?
- How do conversion rates vary by user segment?
- What's the correlation between traffic quality and lifetime value?

Timing & Urgency:

- How does time spent in funnel correlate with conversion likelihood?
- Do limited-time offers meaningfully impact conversion rates?
- What's the optimal follow-up timing for abandoned conversions?

Experience Refinement

Adding delight and premium feel to interactions.

Micro Interactions — Delight moments that make the product feel alive

Small Quirk — Unique element that represents your product's character

Loading Feedback — Reducing perceived wait time through smart feedback

Success Moments — Rewarding immediately after completing key action

Perceived Effort Delay — Increasing perceived value with a timely pause

Supporting Plays

Pattern Alignment — The familiarity of interactions, flows & behaviours

JTBD Copywriting — Choose words that move users forward

Variable Reward — Just the right amount of unpredictability

Progressive Disclosure — Unravelling of information layers & product complexity

Insights & Metrics

Quantify the impact of your experience refinement efforts.

1. Task Success Rate

- Formula: (Tasks completed successfully / Total task attempts) × 100
- What it measures: How easily users can accomplish their goals
- Why it matters: Direct measure of usability and user frustration

2. Average Session Duration

- Formula: Total time spent / Number of sessions
- What it measures: User engagement and interface satisfaction
- Why it matters: Indicates whether users find the experience valuable enough to stay

3. User Satisfaction Score (CSAT/NPS)

- Formula: Standard CSAT or Net Promoter Score surveys
- What it measures: Overall user happiness with the experience
- Why it matters: Directly correlates with retention and word-of-mouth growth

4. Error Rate

- Formula: (User errors or failed actions / Total user actions) × 100
- What it measures: Interface clarity and system reliability
- Why it matters: High error rates indicate poor UX design or technical issues

Behind the Data

Discover where the experience feels clunky, inconsistent, or unintentionally frustrating.

Usability Optimisation:

- Which tasks have lowest success rates and why?
- How does task performance vary across different devices?
- What types of errors occur most frequently?

Experience Quality:

- Which interface elements contribute most to user satisfaction?
- How do micro-interactions impact overall experience perception?
- What's the correlation between session duration and satisfaction?

Design Effectiveness:

- Which design patterns work best for your user base?
- How do loading states and feedback affect perceived performance?
- What level of interface customisation do users actually use?

Intent Shaping

Guiding user actions to increase commitment and product fit.

Investment — Small actions that increase attachment

Personalisation — Designing relevance into the product experience

Setup Defaults — Instant, semi-automated jumpstarts

Progressive Disclosure — Unravelling of information layers & product complexity

Commitment — Let users declare their intent, then design around it

Supporting Plays

Effort Moat — Turn invested effort into loyalty by acknowledging it

Intent Mirroring — Reflect user behavior in real time to build trust and drive action

Success Moments — Rewarding immediately after completing key action

Sandbox Experience — Product access without account creation friction

Insights & Metrics

Quantify the impact of your intent shaping efforts.

1. **Profile Completion Rate**
- Formula: (Users with complete profiles / Total users) × 100
- What it measures: How much information users are willing to provide
- Why it matters: More complete profiles enable better personalisation and targeting

2. **Abandonment Rate**
- Formula: (Forms started but not completed / Total forms started) × 100
- What it measures: User willingness to complete data input processes
- Why it matters: Identifies friction in data collection flows

3. **Task Success Rate**
- Formula: (Tasks completed successfully / Total task attempts) × 100
- What it measures: How easily users can accomplish their goals
- Why it matters: Direct measure of usability and user frustration

Behind the Data

Explore what's shaping user intent, where momentum builds, where it breaks, and how early decisions shape long-term behaviour.

Collection Optimisation:

- Which data fields have highest abandonment rates?
- How does form length impact completion rates?
- What's the optimal timing for requesting different types of data?

Data Value:

- Which collected data points provide most business value?
- How does data completeness correlate with user engagement?
- What's the relationship between data quality and personalisation effectiveness?

User Behaviour:

- When are users most willing to provide information?
- Which data requests feel reasonable vs intrusive?
- How does progressive data collection compare to upfront collection?

Habit Formation

Creating sticky, repeated usage patterns.

Commitment — Let users declare their intent, then design around it

Gamified Progress — Game mechanics that trigger habit loops and user return

System Widget — Real-time value and connection right from the home screen

Variable Reward — Just the right amount of unpredictability

Value Replay — Resurface momentum across channels to reinforce value

Investment — Small actions that increase attachment

Personalisation — Designing relevance into the product experience

Supporting Plays

Success Moments — Rewarding immediately after completing key action

Micro Interactions — Delight moments that make the product feel alive

Effort Moat — Turn invested effort into loyalty by acknowledging it

Deep-link — Drop users into the exact moment, feature, or context that matters

Insights & Metrics

Quantify the impact of your habit forming loops.

1. **Weekly Active Users (WAU)**
- Formula: Number of unique users active at least once per week
- What it measures: Consistent usage pattern development
- Why it matters: Regular weekly usage indicates habit formation better than daily spikes

2. **Session Frequency**
- Formula: Average sessions per user per week
- What it measures: How often users return to the product
- Why it matters: Frequent return visits are the core indicator of habit formation

3. **Streak Completion Rate**
- Formula: (Users who maintain 7+ day streaks / Users who start streaks) × 100
- What it measures: User ability to maintain consistent behaviour
- Why it matters: Streaks are proven to reinforce habitual behaviour

4. **Return Rate After 30+ Days**
- Formula: (Users who return after 30 days of inactivity / Users who were inactive for 30+ days) × 100
- What it measures: Long-term habit stickiness beyond short-term streaks
- Why it matters: Returning after long breaks signals meaningful product attachment

Behind the Data

Understand what drives repeat use and what weakens the cycle.

Premium Value Delivery:

- Do premium users have higher satisfaction than basic users?
- Which premium features drive highest usage and satisfaction?
- How does premium user retention compare to basic user retention?

Pricing Power:

- How do conversion rates change at different price points?
- What's the optimal price increase that maintains conversion quality?
- Which user segments show lowest price sensitivity?

Premium Experience:

- Do premium touches (animations, delays, polish) correlate with higher ARPU?
- How does premium onboarding affect long-term value perception?
- Which premium positioning elements most effectively justify higher prices?

Premium Positioning

Making the product feel high-value and sophisticated.

Perceived Effort Delay — Increasing perceived value with a timely pause

Small Quirk — Unique element that represents your product's character

Micro Interactions — Delight moments that make the product feel alive

Intentional Friction — Introduction of purposeful slowdown

Loading Feedback — Reducing perceived wait time through smart feedback

Supporting Plays

Success Moments — Rewarding immediately after completing key action

JTBD Copywriting — Choose words that move users forward

Pattern Alignment — The familiarity of interactions, flows & behaviours

Progressive Disclosure — Unravelling of information layers & product complexity

Insights & Metrics

Quantify the impact of your premium reputation efforts.

1. **Average Revenue Per User (ARPU)**
- Formula: Total revenue / Total number of users
- What it measures: How much users are willing to pay for your product
- Why it matters: Core indicator of premium pricing power and perceived value

2. Price Sensitivity (Conversion by Price Tier)
- Formula: Conversion rate at different price points during testing
- What it measures: User willingness to pay premium prices
- Why it matters: Shows if users perceive enough value to justify premium pricing

3. Customer Satisfaction (Premium Features)
- Formula: CSAT score specifically for premium/advanced features
- What it measures: Whether premium features deliver expected value
- Why it matters: Premium users should be more satisfied to justify higher prices

Behind the Data

Decode how users perceive quality and where polish, detail, or friction is elevating or eroding the experience.

Usage Pattern Development:

- What time of day do users most consistently engage?
- How does session frequency change over the first 30 days?
- Which users successfully transition from sporadic to regular usage?

Habit Reinforcement:

- How effective are different reminder strategies?
- What's the correlation between streak length and long-term retention?
- Which commitment mechanisms work best for different user types?

Behavioural Triggers:

- What external factors influence consistent usage?
- How do social features impact habit formation?
- Which progress indicators most effectively motivate continued use?

Micro Interactions

Subtle feedback loops that make digital products feel tactile and alive.

What it is:
Small, functional animations triggered by user actions. Taps, swipes, hovers, holds, or transitions that reinforce the cause-and-effect loop of interaction.

Why it works:
They confirm intent, reduce uncertainty, and inject life into the interface. When done right, they make your product feel responsive, tactile, and thoughtfully built.

When to use it:

- On user actions: taps, clicks, drag & drops
- During transitions between states or screens
- On success, error, or confirmation moments
- As ambient feedback during navigation or loading

Do:

- Use micro-interactions to confirm the app is responding
- Add subtle animation to reinforce feedback loops and user flow
- Use haptics sparingly to enhance key moments
- Let users toggle haptics in settings for control and accessibility

Don't:

- Over animate basic interactions. Too much movement becomes noise
- Use animations that delay the experience or feel gimmicky
- Use complex sequences that slow down flow.

Founder Tip:
Small polish often feels premium quality to users but only when used intentionally. If your product doesn't feel alive, and responsive, it feels broken.

Pair with: ***Permission Serve*** | ***Success Moments*** | ***Loading Feedback*** | ***Gamified Progress*** | ***Small Quirk***

Make It Yours

If your product doesn't feel alive, it risks feeling broken. Use these prompts to fine-tune where, why, and how your product should respond to users.

1. To identify high-impact touchpoints:

- Where do users need reassurance that their action was received?
- What moments in your product feel static, cold, or uncertain?
- Are there actions where users hesitate, wondering if the app is still working?

2. To choose the right interaction type:

- Would a subtle nudge (vibration, bounce, shimmer) clarify what just happened?
- How might you signal state change (success, error, transition) with motion instead of words?
- What kind of feedback would feel native to your product: visual, haptic, or both?

3. To avoid going overboard:

- Where does motion currently get in the way of speed or clarity?
- Are there animations that feel playful... but slow users down?
- How might we remove animation that adds noise, not value?

4. To align with brand and tone:

- What does motion look like for your brand? Is it snappy, smooth, playful, or minimal?
- Could a signature micro-interaction become part of your product's identity?
- Where might delight be better expressed as subtle craft rather than big theatrics?

5. To test and evolve:

- Where are users still tapping twice or reloading signs of no feedback?
- How would a user describe the "feel" of using your product in one word?
- What's one interaction you could polish this week that would make the product feel sharper?

Empty States

Turning blank screens into activation opportunities.

What it is:
Empty states appear when there's no content to show yet. Instead of leaving users stranded, they're your chance to guide, inspire, and onboard.

Why it works:
A blank screen is a dead end. But a clear, helpful empty state nudges action, sets expectations, and turns nothing into momentum. It's your first impression and a chance to make understanding the next steps easy for users.

When to use it:

- When a page would otherwise be blank: after signup, first use, or clearing content
- When filters or search open, also when they return no results
- During onboarding flows where input is expected but users lack context

Do:

- Add a short headline & helpful microcopy that explains what to do next
- Show what good looks like use illustrations, examples, or demos
- Align tone with your brand voice friendly, clear, never robotic

Don't:

- Leave the screen empty or cryptic ("No items found." is not enough)
- Assume users know what to do without instruction
- Make empty states static, they should be a prompt to inspire action

Founder Tip:
Every empty state is a chance to teach, inspire, and build trust. The first tap forward starts here. A great empty state can trigger activation.

Make It Yours

A blank screen is either a dead end or an open door. Use these questions to make sure your empty states invite action not confusion.

To recognise where empty states exist:

- Which screens in your app show nothing when users first arrive?
- What happens when filters or searches return no results?
- Are there parts of the onboarding journey that assume user input before anything appears?

2. To frame the opportunity:

- What action do you want the user to take in this moment?
- What fear, doubt, or question might they have while looking at this empty state?
- Could this be the first time they're seeing your product, what impression are you leaving?

3. To design with clarity and care:

- What's the one message users need to hear right now to take action?
- Can you add a visual cue or example of what "good" looks like?
- How might you teach through the UI instead of relying on tooltips or docs?

4. To align with brand and flow:

- What tone matches your brand: instructional, playful, confident?
- Could this screen reflect your product's core value in a small, immediate way?
- How might the empty state feel like progress rather than a void?

5. To evolve and test:

- Are users bouncing off this screen or taking the intended next step?
- What questions or support requests come from users stuck here?
- Could a revised empty state increase conversion or onboarding success?

Success Moments

Rewarding users immediately after completing a key action.

What it is:
Short, uplifting moments triggered by meaningful actions a completed task, milestone, or step designed to pause the flow, acknowledge progress, and reward emotionally.

Why it works:
Our brains crave feedback loops. A well-timed success moment delivers validation, breaks up heavy flows, and fuels motivation. Positive reinforcement build habits.

When to use it:

- During onboarding to mark checkpoints (25%, 50%, 75%)
- After high-effort tasks or as momentum boosters in dull flows
- Before asking for feedback, referrals, or permission

Do:

- Use celebratory micro-interactions, brand flourishes, and warm copy
- Acknowledge effort, not just outcomes. Build up your users
- Keep the moment short but emotionally charged

Don't:

- Overuse or fake it only celebrate real progress
- Disrupt flow with long animations or loud effects
- Skip these moments in high-friction experiences

Founder Tip:
Use success moments sparingly they should feel earned, not expected.
Success is momentum. Nail the timing, the uplifting feeling and users will be receptive to what comes next.

Make it Yours

A well-timed success moment unlocks momentum. Use these prompts to craft celebration that feels earned, emotional, and motivating.

1. To uncover when success should be marked:

- What tasks in your product require real effort or focus to complete?
- Where do users reach a point that deserves acknowledgment but currently gets none?
- Are there steps that feel like emotional “wins” even if they aren’t end goals?

2. To calibrate the emotional tone:

- What emotion should users feel in this moment, relief, pride, joy, encouragement?
- How might we match that feeling with subtle animations, copy, or sound?
- Could your brand celebrate success with a signature tone or touch?

3. To avoid celebration fatigue:

- Are we rewarding too often or too early diluting the impact?
- Does the moment feel earned, or does it feel like a participation trophy?
- Are we interrupting the flow when users want to stay in motion?

4. To make success meaningful:

- How might we acknowledge the effort not just the result?
- Could we reinforce progress with a nudge toward what’s next?
- What’s the next best action after the celebration do we guide it clearly?

5. To refine and evolve:

- Where are users most likely to churn could a success moment re-engage them?
- What feedback (or silence) are we getting after key user actions?
- If we stripped away the success moment, would the product feel less alive?

Loading Feedback

Reducing perceived wait time through smart feedback.

What it is:
Custom loading states that replace dead spinners with character-rich moments animations, microcopy, or context-aware visuals that make waiting feel intentional.

Why it works:
Loading feedback distracts from delay, reinforces your brand voice, and creates a moment of emotional connection. Users will remember how it made them feel.

When to use it:

- Whenever operations take longer than ~100ms: page loads, file uploads, searches
- When fetching, generating, or uploading content
- In loops where users frequently return (e.g., dashboard refreshes, edits)

Do:

- Design the loading state as a branded, ownable moment
- Match the feedback to the task (e.g., photos stacking when building album)
- Use personality-driven microcopy or visuals to create a delightful moment

Don't:

- Leave screens blank or frozen
- Use vague messages like "Please wait..." without context
- Show generic poorly matched spinners or loading bars

Founder Tip:
Every product has friction. The best ones make it feel worthwhile. Don't just explain the wait, use it to express your brand's tone of voice and personality.

Pair with: *Micro Interactions* | *Success Moments* | *Perceived Effort Delay* | *JTBD Copywriting* | *Small Quirk*

Make It Yours

Turn dead time into purposeful, branded moments.

1. To spot where feedback is missing:

- Where do users wait in your product, loading, uploading, syncing, generating?
- Are there screens that freeze or feel static during transitions?
- What's the longest delay a user might experience and how does that moment currently feel?

2. To add emotional context:

- What emotion are users likely feeling while they wait, anticipation, frustration, boredom?
- How might we surprise or reward them during this moment?
- Could humour, charm, or brand personality be embedded into the wait?

3. To design with purpose:

- What metaphor, animation, or microcopy would feel native to the task at hand?
- Can we use this time to reinforce trust or teach something?
- How might your loading state feel more like a feature than a filler?

4. To match tone and task:

- Should this moment feel quick and snappy or calm and reassuring?
- How would your product "speak" during a delay if it had a personality?
- Could you use a visual that mirrors progress or explains what's happening?

5. To refine and test:

- Do users abandon during long waits or do they stay engaged?
- Are users commenting on "slowness" or lack of clarity?
- If we removed the feedback, what would feel broken or confusing?

Personalisation

Designing relevance into the product experience.

What it is:
It tailors the product to reflect the user's identity, behaviour, goals, or preferences, either explicitly (through inputs) or implicitly (through usage patterns). It adapts the interface, content, or interactions.

Why it works:
We notice relevance. When a product reflects our intent, it reduces friction. Personalisation can significantly enhance relevance, attachment, and perceived value.

When to use it:

- During onboarding to shape the product around their intent
- When recommendations, layouts, or content types can adjust meaningfully
- When adaptive copy, themes, or behaviour increases delight or stickiness

Do:

- Use declared input (e.g. stated goals) and inferred behaviour (e.g. skipped content)
- Learn from user behaviour and surface tailored features/content
- Highlight personalised content or progress to increase ownership & perceived value

Don't:

- Over-personalise in intrusive ways (e.g., surfacing sensitive info)
- Break consistency or usability in the name of "personal touch"

Founder Tip:
Personalisation isn't just about showing users who they are, it's about helping them become who they want to be. Use it to reduce friction, and make your product feel like it's made just for them.

Make It Yours

Design experiences that feel personal, relevant, and irreplaceable.

1. To spot where personalisation could be added:

- Where in your product does every user currently see the same thing?
- Which screens or flows feel most “one-size-fits-all” today?
- Are there choices or settings users repeatedly adjust that could be remembered or predicted?

2. To gather smart signals:

- What data has the user already given us (explicit or behavioural)?
- Where are users skipping, bouncing, or repeating actions, signs of mismatch?
- How might we infer intent from what users avoid as much as what they engage with?

3. To make personalisation visible:

- Are we showing users that the product is adapting to them, or is it invisible?
- How might we highlight a change that was made “just for them”?
- Could we thank the user for teaching the product what to show next?

4. To balance precision and privacy:

- Are we surfacing anything that might feel creepy, overreaching, or too soon?
- Where should we ask for preferences instead of guessing?
- Could we give users a moment of control to adjust or undo personalisation?

5. To maintain the moat:

- If a competitor cloned your UI, what about your personalisation would still set you apart?
- How much friction would a user face trying to get this level of tailoring elsewhere?
- What’s one small thing we could do that would make users feel deeply “seen”?

JTBD Copywriting

Choose words that move users forward with clarity and purpose.

What it is:
Conversion-focused copy that frames actions through the user's desired outcome. It shifts from describing what a feature does to showing what the user can achieve with it.

Why it works:
People don't want tools. They want results. When words reflect their intention it creates momentum. JTBD copy removes friction, builds confidence, and keeps users oriented around their goal.

When to use it:
- Everywhere, buttons, onboarding steps, tooltips, error states
- Anywhere you need to prompt action, calm hesitation, or frame next steps

Do:
- Frame tasks as outcome-driven actions
- Match voice to mindset: reassuring where there's hesitation, warm during effort
- Foreshadow what comes next give a sense of control and purpose

Don't:
- Use jargon or overly complicated phrases
- Describe the features of the app
- Use generic CTAs like "Submit" or "Continue" where context could work

Founder Tip:
Every word in your UI is a tiny nudge. Default to the user's why, not your what. A good test: read it aloud after "Now you can...", if it doesn't make sense, rewrite it.

Make It Yours

Copy isn't just what you say, its how you and when you say it. Use these questions to write words that guide, empower, and convert.

To understand the user's job:

- What outcome is the user trying to achieve on this screen?
- What emotion are they likely feeling right now uncertainty, ambition, relief?
- Are we writing from the product's perspective, or the user's lived experience?

2. To evaluate existing copy:

- Does this text explain the interface or the benefit of taking action?
- Are we telling users what they can do or why they should care?
- Could we rewrite this to reflect the user's language, not ours?

3. To add momentum:

- How might we collapse hesitation with a single empowering phrase?
- Could we foreshadow the next step to give a sense of flow and progress?
- Are our buttons inviting action or just describing it?

4. To emotionally connect:

- Where can we show empathy or understanding in just a few words?
- What's at stake for the user if they don't act?
- Could this line of copy feel like advice from a coach, not a UI robot?

5. To test and refine:

- What words have users responded to most, do we use those everywhere?
- Are there places where users slow down or bounce, what might the copy be missing?
- If we stripped this sentence down to six words, would it still move the user forward?

Calm Sleep

Permission Serve

System-level access to user data or communication permissions.

What it is:
The request for access to system-level features (location, notifications, camera, mic) framed with intent and purpose.

Why it works:
By anchoring the ask to a feature they care about, you shift the prompt from intrusive to useful. Timely, relevant requests drive trust and opt-in rates.

When to use it:
- Before an action when access is required to proceed
- After the action if permission enhances the experience but isn't initially required

Do:
- Time your ask to the user's intent always tie it to functional relevance
- Pre-frame the benefit with a short in-app message or preview
- Make the prompt feel like progress, unlocking further benefit

Don't:
- Trigger multiple permission requests back-to-back
- Ask for access too early before trust or context is established
- Request permissions that don't help improve the experience for users

Founder Tip:
You only get one shot at serving the native opt-in, time your ask purposefully. Pre-frame it with a skippable screen that triggers the native permission. Time it with care, and ensure it feels like part of the journey, not an interruption.

Make It Yours

You're not asking for access you're offering value. Use these prompts to frame permission requests as progress, not friction.

1. To identify the right moment to ask:

- When does the user actually need this permission to move forward?
- Are we asking before they care about the feature, or right when it becomes relevant?
- Could we show a preview or partial experience first to build anticipation?

2. To anchor the ask in value:

- What is the user trying to achieve at this moment?
- How does this permission make the feature better, faster, or more personal?
- Could we explain the "why" in a single, emotionally resonant line?

3. To avoid breaking trust:

- Are we stacking multiple permission requests too close together?
- Is there any ask that feels disconnected from the user's immediate goal?
- Would this request feel like a natural step or an interruption?

4. To test and improve the flow:

- Where are users saying "No" and why?
- Could we delay the ask until more context or trust is built?
- What's one small UX or copy change that could boost opt-in rates?

5. To reflect on tone and timing:

- If this were a landing page, would it convert?
- Are we treating this ask with the same care as we would a product pitch?
- How might we make this moment feel like momentum?

Intentional Friction

Introduction of purposeful slowdown to drive clarity, confidence, or commitment.

What it is:
Strategically placed friction in a flow not to block, but to pause and think. It's increased effort by design. The goal isn't to avoid moving faster, it's to move with purpose.

Why it works:
It helps users make better decisions, prevents mistakes, and improves input quality.

When to use it:
- High-stakes actions like deleting data or making purchases
- Limiting features before converting users through a paywall
- Requiring user input to build a personalised experiences

Do:
- Time the friction by first providing context
- Reveal the optimised experience once user converts
- Create moments that educate, protect, or deepen commitment

Don't:
- Add unnecessary friction that doesn't help user progress
- Assume all friction is bad; context matters
- Add friction without purpose or feedback

Founder Tip:
Not all friction is bad. Incorporating friction isn't about making tasks harder it's about making experiences thoughtful and guided to reveal the payoff a user will value.

Make It Yours

Friction isn't the enemy, confusion is. Use these prompts to slow the flow with intention, clarity, and care.

1. To find the right moment for friction:

- Where in your flow is speed causing mistakes or regret?
- Are users skipping steps they should consider more carefully?
- Which decision points could benefit from a pause or checkpoint?

2. To frame friction as value:

- What can we teach, clarify, or reassure the user of in this moment?
- How might this friction build trust, not resistance?
- Could we reveal a better experience after this step to reward the effort?

3. To calibrate effort:

- Does this step feel appropriately challenging or just annoying?
- What would make this feel like a meaningful choice, not a roadblock?
- Are we asking for effort at the right time in the journey?

4. To avoid misuse:

- Are we adding steps because we want control or because users need clarity?
- Could we combine two moments of friction into one smoother step?
- Is this friction backed by a clear purpose or outcome?

5. To iterate and evolve:

- Where are users dropping off, could friction or the lack off be to blame?
- Could micro-feedback help users feel progress during the pause?
- What does success look like after friction is introduced?

Time to Value

Gap between the first touchpoint and experiencing the product's benefit.

What it is:
The amount of time or invested effort it takes for a new user to experience the solution or benefit that triggered the user to download your product.

Why it works:
Users don't sign up to wonder, they hire your app to achieve a goal. Reaching what users were promised is the only reason they will activate, convert and stick around.

When to use it:
- Increased importance during onboarding and activation
- When introducing users to a new feature
- When your product's "aha" moment lives deep in the flow

Do:
- Nudge users to the core feature they must reach
- Strip distractions, only surface what's required to reach the core value
- Guide users through hoops that help them understand and experience value

Don't:
- Overwhelm users with features or unnecessary noise
- Show empty states that don't nudge users forward with context
- Lead users into dead ends where they have to think about what to do next

Founder Tip:
Build backwards from the ''aha moment", that's your product's promise. Ruthlessly optimise every touchpoint to flow users into it. Anything that delays or distracts from value is noise that blocks users away from sticking.

Pair with: *Gamified Progress* | *Intentional Friction* | *Progressive Disclosure* | *Empty States* | *Setup Defaults* | *Commitment* | *Discovery*

Make It Yours

Users don’t explore, they search for payoff. These prompts help you remove the noise and get them to the “aha” as fast as possible.

1. **To uncover where value sits in your app:**
- What is the core reason users download your app?
- If your app disappeared tomorrow, what specific outcome would users miss most?
- Which feature represents the “aha moment” for most users?

2. **To audit the current flow:**
- How many steps does it take for a new user to reach that “aha” moment?
- What gets in the way of users experiencing value in under 3 minutes?
- Are there unnecessary prompts, modals, or tours slowing things down?

3. **To design for faster value:**
- How might we let users feel success before they finish onboarding?
- Could you give users a preview or partial experience of the core benefit instantly?
- What’s one thing we could remove to halve the time to value?

4. **To personalise the play:**
- What does “value” mean in your product? (Time saved, knowledge gained, money made?)
- In a worst-case scenario, a user gives you just 30 seconds, what do they see, do, and feel?
- How might we signal progress or success visually or emotionally, even before full value is delivered?

5. **To test and evolve:**
- How might we measure if our changes reduce time to value?
- What would a “speedrun” of your product look like for a power user?

Setup Defaults

Instant, semi-automated jumpstarts that reduce friction from the start.

What it is:
A proactive design with shortcut content, templates, or flows that gives users a head start. You're educating user by handing them something ready to use.

Why it works:
It gives users an instant starting point through pre-filled content, smart defaults, templates, or guided flows so they can use the product guided by example.

When to use it:

- When setup involves a large effort in content creation, configuration, or setup
- To jump start users into taking action faster
- During onboarding when user is yet to reach first value

Do:

- Use templates, example data, or personalised content
- Guide through action offer pre-filled fields, starter flows, or suggested prompts
- Let users edit or skip defaults easily, teach by example but allow edit control

Don’t:

- Drop users into empty builders or dashboards without guidance
- Overload the screen with too many templates or setup choices
- Lock users into rigid defaults they can’t change

Founder Tip:
A strong default removes uncertainty, delivers value faster, and makes the user feel like they’ve already started making progress. That momentum drives action.

Make It Yours

Don’t just teach users how, show them “done.” Use these prompts to turn setup into momentum.

1. To uncover what defaults make sense:

- What does a “ready-to-use” version of your product look like?
- Where do users currently hesitate or get stuck during setup?
- Which fields or flows could be pre-filled without sacrificing clarity?

2. To design smart, flexible defaults:

- Could we offer templates or starter content based on user type or goal?
- Are we handing users something they can immediately edit and play with?
- How might we make users feel like they’ve already made progress?

3. To balance automation with control:

- Can the user clearly see what’s been pre-filled and why?
- Is it easy for them to tweak or skip these suggestions?
- Are we respecting their autonomy, or locking them into our defaults?

4. To drive faster value:

- Where could a default get them to first value in half the time?
- Could we offer a “start with example” option at key moments?
- What’s one thing we can pre-do for the user that feels helpful, not presumptuous?

5. To test and refine:

- Where do users abandon setup and could a better default prevent it?
- Are there too many options creating paralysis?
- Which default paths convert best and why?

Craft

Progressive Disclosure

Phased unravelling of information, layers and product complexity.

What it is:
A sequencing technique that prioritises clarity. Show only what matters in the moment and unlocks deeper layers of functionality as the user progresses.

Why it works:
Reduces anxiety, helps users focus, and increases product comprehension. Respecting mental bandwidth makes the tasks feel easier to complete and navigate.

When to use it:

- When your product requires content creation, detailed setup, or customisation
- When users benefit from slowing down and increase focus on critical tasks
- When your app is a multi-layered product with advanced capabilities

Do:

- Let experienced users skip ahead while giving beginners guardrails
- Stage complexity in parallel with user confidence or time-on-task
- Plan accordingly which features the initial disclosure level should contain

Don't:

- Force users through multi-step flows when one step would suffice
- Make users hunt or guess how to access deeper functionality
- Over-engineer paths with unnecessary sequencing

Founder Tip:
Your product may be layered, but it shouldn't feel overwhelming. Pace what you reveal, layer context, and never show more than what the user needs to act.

Make It Yours

Don’t show everything, show what matters right now. These prompts help you reveal product power without overwhelming the user.

1. To identify what should be disclosed first:

- What does a first-time user absolutely need to see or do?
- Which features can be safely delayed until the user shows intent or readiness?
- What’s the minimum useful version of this screen or flow?

2. To guide the gradual reveal:

- Where do users tend to get overwhelmed or drop off?
- What are clear signs that a user is ready for more complexity?
- How might we use time-on-task or prior choices to unlock next steps?

3. To balance simplicity with power:

- Could experienced users jump ahead without penalty?
- Are we layering depth in a way that feels natural not like a maze?
- What advanced options could we keep hidden but easily accessible?

4. To make progression feel seamless:

- Does each added layer feel like progress or cognitive load?
- Are we using language and UI affordances to clearly signal what’s new?
- Could we test a “just-in-time” reveal for deeper features?

5. To validate and iterate:

- Are users asking where something is or discovering it organically?
- Where are we forcing steps that don’t match user confidence?
- Is our flow flexible for both fast and slower learners?

Habits
James Clear · Jan 21, 2019 · 9 min
In this article, I'd like to share 30 "one-sentence stories" about building better habits. (They are not all *exactly* one sentence, but they are very short.)
None of these stories are mine. They were sent to me by readers of Atomic Habits. My hope is that these examples will illustrate how real people are putting the book into practice. They will show you what people are actually doing to build good habits and break bad ones. And hopefully, they will spark some ideas for how you can do the same.
I have divided the stories into categories that roughly correspond to different sections or ideas in the book.

Matter

Commitment

Let users declare their intent, then design around it.

What it is:
A micro-pledge from the user. A goal, schedule, or selection. You're inspiring behaviour by letting users make a commitment they will feel obliged to complete.

Why it works:
Once we state our intentions, we feel the need to follow through. Even a small commitment public or private nudges us to act. Declarations create accountability which trigger consistency that leads to retention.

When to use it:
- When the product requires users to frequently check into the app
- To inspire activation in a demanding flow (e.g. learning, saving, tracking)

Do:
- Trigger follow-ups that tie back to what user has committed to
- Let users choose their own goal, frequency, or commitment
- Tie the commitment to future nudges, reminders, or feedback

Don't:
- Force arbitrary goals onto users
- Make the commitment feel like a irreversible trap
- Punish users for breaking commitments without flexibility

Founder Tip:
When users say what they want, help them become it. Apps that remember and reflect user intent build deeper loyalty and stickiness. Give users a goal and they'll have a purpose to retain.

Pair with: ***Personalisation*** | ***Gamified Progress*** | ***Time to Value*** | ***Deep-link*** | ***System Widget*** | ***Intent Mirroring***

Make It Yours

When users declare their intent, help them live up to it. These prompts help you turn commitment into structure, not pressure.

1. To design the right kind of commitment:

- What habit, outcome, or frequency matters most in your product?
- How might a user pledge feel like progress, not pressure?
- Could a lightweight goal or schedule boost activation or retention?

2. To create space for intent:

- Where in your flow could you ask, “What do you want out of this?”
- Could users pick their own pace, metric, or end goal?
- How might this commitment feel personal and empowering?

3. To build follow-through loops:

- Are we tying nudges, reminders, or tips to what the user said they wanted?
- What check-ins could help users feel momentum not guilt?
- How might we celebrate progress, even if they slip?

4. To avoid coercion or shame:

- Are we offering the choice to commit or forcing it?
- Is there a clear way to update, edit, or back out of a goal?
- Do users feel safe making imperfect progress?

5. To test and evolve:

- Are committed users more consistent or loyal?
- Where do drop-offs happen after a pledge and why?
- What signals suggest a user is ready to commit?

Speechify

Deep-link

Drop users into the exact moment, feature, or context that matters.

What it is:
The ability to direct users attention to a specific screen, state, or flow inside your product, bypassing layers of navigation.

Why it works:
It respects user intent by reducing effort and confusion. It points users directly to the tasks maintaining focus on the task.

When to use it:

- Returning user picking up where they left off
- To inspire activation in a demanding flow (e.g. learning, saving, tracking)
- In user-to-user sharing or referrals

Do:

- Route users to the exact context relevant to the message or CTA
- If sending users out of the app, guide them back into where they left
- Use deep-links to bridge channels (email → app, web → app)

Don’t:

- Dump users on a generic page after promising something specific
- Forget to test for logged-out users, edge cases, or navigational detours

Founder Tip:
Deep links are portals to value. Respect your user’s time and attention by helping them find the exact flow instantly.

Make It Yours

When users expect specificity, don't send them searching. Use these prompts to drop them exactly where value lives.

1. To define where deep-links should lead:

- What's the most valuable or actionable place to drop a returning user?
- Are there moments in your app that are buried too deep behind menus?
- What parts of your product are commonly referenced in emails, messages, or support?

2. To ensure contextual continuity:

- Could this link pick up where the user left off?
- Does this entry point match the promise made in the message or CTA?
- How might we maintain flow across devices or platforms?

3. To optimise the experience:

- What happens if a logged-out user clicks this deep-link?
- Are we testing edge cases like expired sessions, deleted content, or outdated links?
- Can we tailor the screen users land on depending on their intent or goal?

4. To increase trust and activation:

- Does this feel like a personal shortcut or a marketing trap?
- Could we use deep-links to onboard a user into the right moment, not just the home screen?
- Are we nudging users toward action, not just information?

5. To evaluate effectiveness:

- Where do users most often drop off after clicking in?
- Are we measuring how many users actually complete the task from a deep-link?
- What kinds of deep-links perform best, returning, shared, or cross-channel?

Contact Bridge

Connect with users' existing networks to enhance engagement and growth.

What it is:
Allow users to sync their phone contacts to instantly find friends or invite people they know. This lowers the barrier to early engagement and builds a sense of connection from day one.

Why it works:
Syncing contacts at the right time unlocks instant social proof, lowers the barrier to connection, and leverages existing relationships to boost adoption.

When to use it:

- During onboarding to encourage immediate network building
- As part of referral campaigns to streamline invitations
- In social, productivity, or community-based apps where connections are core

Do:

- Show immediate value (e.g. "These 4 friends are already here")
- Highlight active friend counts to motivate connections
- Preload recognisable names or profile suggestions

Don't:

- Ask for permissions too early, before you've built trust
- Hide the purpose behind vague language ("Improve your experience...")

Founder Tip:
Use contact syncing as a gentle nudge to bridge offline relationships into the app. Highlight mutual connections to spark interest.

Make It Yours

We love to join where other people are. Use these prompts to lower the barrier to connection and boost engagement from day one.

1. To time the ask:

- When in your flow does a user most need encouragement to keep going?
- Have we earned enough trust yet to ask for contact syncing?
- What early win could we show immediately after they grant access?

2. To frame the purpose:

- Are we being direct and honest about why we want access?
- Could we say, “See who’s already here” instead of “Improve your experience”?
- What specific benefit does contact syncing unlock for the user right now?

3. To surface meaningful connections:

- Can we preload recognisable names or avatars?
- Could we show live activity (“X just joined” or “Y is active”)?
- How might we use social proof to encourage interaction not just invite spamming?

4. To reduce friction and discomfort:

- Is it obvious what the user is agreeing to and what happens next?
- Are we giving users full control (skip, edit, or limit syncing)?
- Could we delay the ask until there's a clear reason to connect?

5. To test and adapt:

- What % of users who sync contacts take a next step?
- Are we seeing higher retention among connected users?
- Where do users bounce at the permission request, or after?

System Widget

Real-time value and connection right from the home screen.

What it is:
Home screen components that surface live, contextual or meaningful content without needing to open the app.

Why it works:
Widgets collapse time-to-insight. They feel personal, timely, and emotionally relevant, making your app feel present and helpful like a always-on, personal companion.

When to use it:

- When your product supports daily rhythms (habits, streaks, logs)
- When there's recurring live or time-sensitive value (e.g. rides, updates, markets)
- When passive visibility reinforces return (e.g. mood, hydration, step goals)

Do:

- Use glanceable, meaningful visuals. Think single-glance utility
- Tie updates to user-specific metrics, reminders, or rituals
- Edge moments: boredom, waiting, checking phone without purpose

Don't:

- Overload the widget with dense data or irrelevant content
- Treat the widget as a bonus, it's an extension of your core offer
- Use it for static marketing content, it will be removed and harm your brand

Founder Tip:
Home screen is prime real estate, a strong widget is a re-engagement engine. When it shows value at the right moment, it reduces app abandonment. Done right, a widget will build trust, familiarity, and habit.

Pair with: ***Gamified Progress*** | ***Commitment*** | ***Gamified Progress*** | ***Deep-link***

Make It Yours

A strong widget is a re-engagement engine. Use these prompts to design content that earns a permanent spot on the home screen.

1. To define the right value:

- What's the most meaningful information we can surface without opening the app?
- What would users want to see at a glance in moments of boredom, pause, or habit?
- Which aspect of the product feels alive, changing, or worth revisiting daily?

2. To align with user habits:

- How might this widget reinforce a streak, challenge, or behaviour loop?
- Could we turn passive scrolling into productive re-engagement?
- When do users naturally check their phone and how could we meet them there?

3. To design for clarity and context:

- What would make this widget feel calming, lightweight, or motivating?
- Could we design it to feel like a reward not a demand?
- Are we using visuals or copy that resonate emotionally in 2 seconds or less?

4. To avoid becoming background noise:

- What would make a user remove this widget?
- Are we refreshing the content often enough to justify its space?
- Could we personalise what shows up based on context or progress?

5. To measure impact:

- Are users engaging more often with the app after installing the widget?
- How long do widgets typically stay active on the home screen?
- Which variations of widget content perform best?

Value Replay

Resurface progress outside the product to reinforce value.

What it is:
A cross-channel tactic that replays the user's progress, actions, or milestones outside the product. These snapshots reinforce the investment and gently point back to app.

Why it works:
Reminding users what they've achieved is a great attention strategy. It brings value back into focus and makes return feel like continuation, not restart.

When to use it:

- Weekly digests of usage, highlights, or achievements
- Triggered alerts for unfinished actions or expiring opportunities
- Personalised nudges based on previous behaviour
- When usage signals a drop off but progress exists

Do:

- Make it personal (e.g. reference specific content, goals, or outcomes)
- Allow control over frequency and timing
- Include a single, relevant CTA that builds on past momentum

Don't:

- Spam or send generic summaries with no emotional hook
- Overload the user with too many touchpoints, too frequently

Founder Tip:
Features that resurface progress externally (like "You've written 12 journal entries" or "3 new followers found your playlist") act as gentle invitations back and compound the feeling of continuity and identity.

Make It Yours

Frame every message as “Here’s how far you’ve come,” and watch return rates improve. Use these prompts to nudge re-engagement.

1. To decide what to resurface:

- What actions, streaks, or goals are worth celebrating outside the product?
- What would users be proud to see again?
- Are we reminding users of unfinished tasks or progress already made?

2. To personalise with intent:

- Could we tailor messages based on behaviour, time, or milestone?
- Are we using specific details that feel personal (e.g. “Your 5th session” vs. “Welcome back”)?
- How might we echo progress without adding pressure?

3. To choose the right channels:

- Where does the user want to hear from us? email, notifications, widgets?
- Could we bridge platforms (e.g. mobile > desktop) in a seamless way?
- Are we making re-entry frictionless from the reminder?

4. To avoid disengagement:

- Does this message actually mean something or just fill space?
- Could the content make them smile, reflect, or feel seen?
- Are we letting users control frequency or turn off nudges?

5. To measure effectiveness:

- Are reactivation rates improving after an echo message?
- Which type of message brings users back most reliably?
- How long does it take a user to act on the reminder and what’s their next step?

Effort Moat

Turn invested effort into loyalty by acknowledging it.

What it is:
Resurface the user's investment time, energy, or emotion to make their effort feel valuable and hard to abandon.

Why it works:
People value what they build. When a user uploads, completes tasks, or configures their space, they create psychological "ownership" that increases attachment.

When to use it:

- After setup flows, saved preferences, or input-heavy tasks
- During inactivity, to reignite personal momentum
- After they've built a personalised experience (e.g. saved places, uploads, notes, history)

Do:

- Show cumulative stats and progress ("You've saved 27 favourites")
- Reflect input back visually. Dashboards, saved states, timelines
- Elevate earned status (e.g. streaks, social badges, ranks)

Don't:

- Let effort go unacknowledged, neglect leads to disconnection
- Hide user's effort once they have made even a small contribution

Founder Tip:
When users build personal curations e.g. saved spots in Google Maps they develop subconscious switching resistance. This becomes your moat. Take it further: if their contributions lead to social recognition or status, you've helped them build identity. That's loyalty at the highest tier.

Pair with: *Success Moments* | *Gamified Progress* | *Value Replay* | *Investment* | *Time to Value*

Make It Yours

We get attached to what we've built. Use these prompts to reflect effort, reinforce identity, and build psychological switching costs.

1. To spot invested effort:

- Where in your product do users input, organise, or personalise content?
- What actions require repeated effort whether cognitive, emotional, or time-based?
- What setup steps or preferences could become visible proof of progress?

2. To make investment visible:

- Could we reflect their input back as stats, timelines, or saved states?
- What streaks, badges, or social indicators could elevate their status?
- Are we showing how far they've come in a way that feels earned?

3. To create emotional attachment:

- Where can we highlight user-created value (e.g. notes, uploads, collections)?
- Could we let them name, tag, or personalise part of the product?
- How might we make their setup feel like "their version" of the app?

4. To avoid invisibility:

- Are users completing tasks without seeing the impact?
- Could we summarise their contributions in a digest, dashboard, or empty state?
- Are we unintentionally hiding or deleting signs of investment?

5. To validate and deepen the moat:

- Which users have the highest effort footprint and do they churn less?
- What's the average time or number of inputs before retention improves?
- How can we give users a sense of progress even from passive use?

Perceived Effort Delay

Increasing perceived value with a timely pause.

What it is:
A deliberate pause or processing moment that signals care, personalisation, or depth. When outcomes are delivered too fast, we may question their value.

Why it works:
Intentional delay reframes the result as considered and tailored. Our brains link time with effort. When things take longer, we think more care has gone into them.

When to use it:

- When delivering a result, recommendation, or score
- When simulating intelligent processing (e.g. “thinking”, “analysing”, “personalising”)
- If your app offers insight, feedback, or predictions & you want them to feel premium
- When users expect emotional weight or significance (e.g. mental health, finance)

Do:

- Use progress animations or like “Analysing your input”, “Curating your best match”
- Frame the delay with clear intent. It should feel something worthwhile is happening
- Keep the wait just long enough to feel meaningful for the results your app retrieves

Don’t:

- Make users wait unnecessarily
- Use generic spinners with no narrative always frame the pause with purpose
- Overuse the play, constant delays can frustrate

Founder Tip:
Speed feels cheap when the user expects effort. A deliberate pause suggests care, personalisation. It’s not lag. It’s luxury.

Make It Yours

Slowness, done right, signals depth. Use these prompts to design intentional pauses that feel like care.

1. To decide when to pause:

- Are we delivering something that should feel personal, calculated, or important?
- Could a brief delay make the result feel more trustworthy or high-value?
- What moment in the flow deserves a sense of suspense or thoughtfulness?

2. To frame the delay with meaning:

- Could we explain the pause with copy? (“Finding your best match…”)
- What visual or animation could signal care without feeling like a blocker?
- Does the delay match the tone. Calm for health, precise for finance, playful for dating?

3. To calibrate timing:

- Would a 1–3 second pause feel purposeful or just slow?
- Could we test a version that adapts to content complexity or user expectation?
- What’s the emotional goal of this delay: trust, anticipation, significance?

4. To avoid false friction:

- Are users waiting for no good reason? or do they feel something during the pause?
- Could the delay backfire if repeated too often or used in the wrong context?
- Are we using spinners that feel empty? or narrative moments that add clarity?

5. To test user perception:

- Do users trust the result more after a thoughtful delay?
- How does retention or satisfaction change when we add intentional pauses?
- Are people describing the experience as “smart,” “thorough,” or “considered”?

STEP 3: CREATIVITY

Headway

Momentum Bias

Give users a head start, they'll feel compelled to finish.

What it is:
Creating the perception of progress from the start by front-loading actions, pre-filling data, or using visual cues that suggest something is already underway.

Why it works:
We're wired to finish what we've started. Even if we didn't start it ourselves. Seeing progress, however small, inspires commitment and reduces hesitation.

When to use it:

- Onboarding flows with checklist progress or auto-completed first steps
- Signup flows with pre-filled name, avatar, or preferences
- Generated "drafts" for users to edit rather than starting from zero
- Education products that begin with a quiz you're likely to ace, boosting confidence

Do:

- Pre-fill content using smart defaults, past behaviour, or common selections
- Visually show progress: checkmarks, completed bars, "1 of 3 steps done"
- Tie momentum to actual value, not just vanity steps

Don't:

- Lock users into not being able to easily edit the suggested content
- Surface irrelevant filler that don't resonate with user's intent
- Don't confuse users with random progress

Founder Tip:
Momentum is emotional. It's created through thoughtful cues that shift users from hesitation to motion. Your job is to help them believe they're already moving.

Pair with: ***Gamified Progress*** | ***Setup Defaults*** | ***Progressive Disclosure*** | ***Time to Value***

Make It Yours

Progress feels good, even if it's partial. Use these prompts to kickstart action by making effort feel already underway.

1. To find where to create momentum:

- What can we pre-fill, pre-check, or pre-select to show early movement?
- Could we reframe an existing step as "already in progress"?
- Are there low-effort wins users can achieve in the first 30 seconds?

2. To make progress visible:

- Could we show a progress bar, checklist, or badge right away?
- What visual signal could reinforce "you're already on your way"?
- Would a partial draft, saved item, or personalised suggestion reduce hesitation?

3. To balance help vs. overload:

- Are we giving users just enough to feel guided but still in control?
- Could too much default content feel overwhelming or artificial?
- What's one element we can preload that feels like a thoughtful head start?

4. To avoid manipulation:

- Does the progress we show reflect real effort or value?
- Could the user feel tricked or patronised by inflated completion?
- Are we being transparent about what's done and what's left?

5. To measure lift:

- Does early perceived progress improve activation or reduce bounce?
- How many users complete the flow once we show they've started?
- What's the impact of removing vs. adding the momentum bias?

Intent Mirroring

Reflect user behavior in real time to build trust and drive action.

What it is:
A responsive UX pattern that reacts to subtle user behaviours, like pauses, backtracking, or repeated filters by surfacing timely nudges, guidance, or content that aligns with their likely intent.

Why it works:
We feel seen when an app responds to actions. Mirroring takes user behaviour and surfaces relevant actions based on intent. This builds trust and reduces effort. It makes the app feel helpful.

When to use it:

- When users are browsing, hesitating, or stuck in loops
- During onboarding, pricing exploration, or filter-heavy search
- In moments of hesitation (e.g. hovering, scroll-backs, or long pauses)

Do:

- Surface relevant help (“Still comparing plans?”) when patterns are clear
- Use micro-signals to adapt UI, offer a shortcut, template, or filtered result
- Match the user’s current mode: explore, decide, or compare

Don’t:

- Surface suggestions too early, this can feel like noise if irrelevant to intent
- Offer generic nudges that break the illusion of personalisation

Founder Tip:
Intent mirroring is co-navigation. You’re anticipating. When done right, it’s invisible UX that feels magical. The user thinks, “That’s exactly what I needed.”

Make It Yours

When users hesitate, your product should respond. Use these prompts to make your UX feel intelligent, empathetic, and aligned.

1. To detect intent:

- Where are users pausing, hovering, or scrolling back?
- What filters, inputs, or screens are users repeating or spending time on?
- Which behaviours signal interest but not action?

2. To surface smart nudges:

- Could we ask a question based on what they've been doing? ("Still comparing plans?")
- What small hint, autofill, or suggestion might guide them forward?
- Are we reinforcing their curiosity or pushing them?

3. To adapt without intrusion:

- How might we reflect behaviour without stealing attention?
- Could this response feel like a natural continuation and not a pop-up?
- Are we matching tone and timing to their apparent mindset?

4. To avoid overreach:

- Are we interrupting too soon or personalising too much, too fast?
- Could this behaviour mean multiple things and are we assuming the wrong one?
- Is our suggestion genuinely helpful or just trying to convert?

5. To measure impact:

- Does mirroring improve conversion or shorten time to value?
- Where do users bounce after interacting with a mirrored suggestion?
- Are users describing the product as helpful, relevant, or "it just got me"?

Runna

Spark Curiosity

Creating tension between the user, product and the outcome.

What it is:
A tactic that reveals just enough to trigger intrigue, withholding the rest until users take action. It turns product flows into story arcs, where curiosity becomes the driver.

Why it works:
We're wired to resolve gaps in knowledge. When we find something meaningful but incomplete, our brains itch to resolve it. Tap into anticipation, and emotional tension.

When to use it:

- Flows where anticipation can amplify perceived value (quiz results, dating matches)
- When a feature or insight feels valuable, but requires effort or upgrade to unlock
- To tease social status, usage data, or gamified outcomes without full reveal

Do:

- Blur, mask, or hide just enough to spark interest (e.g. "You have 3 new messages")
- Use emotionally-charged copy to frame the mystery ("Someone liked your profile")
- Consider timed reveals or sneak previews to build tension

Don't:

- Overuse. Curiosity only works if the reward feels meaningful and rare
- Create artificial walls that frustrate instead of intrigue
- Leave users in limbo with no clear way to close their curiosity

Founder Tip:
Use it to create pull, not frustration. The best reveals feel earned.. It's not about teasing for the sake of it, it's about designing suspense with a payoff. Trigger meaningful tension through a solvable mystery.

Make It Yours

What can we hint at instead of show? Use these questions to make users lean in and uncover more without forcing it.

1. To frame the tease:

- What value or insight are we partially revealing?
- How can we blur, count down, or conceal just enough?
- Are we guiding users toward the payoff or just teasing without clarity?

2. To create meaning:

- Is the hidden outcome worth discovering?
- Does the copy build emotional tension (e.g. pride, progress, exclusivity)?
- Can we link the mystery to a goal (e.g. complete task → unlock result)?

3. To control timing:

- Would a delayed reveal heighten anticipation?
- Are we using curiosity as a bridge to engagement, not a dead-end?
- Do we resolve the mystery quickly enough to satisfy?

Elevate

Sandbox Experience

Product access without account creation.

What it is:
A frictionless, limited preview of your product, no login walls, or paywalls. Use pre-filled data, temporary access, or capped functionality to help users experience value.

Why it works:
It removes the need to convert through the paywall or effort-based barriers to entry. Users get instant peak into what they can expect. Once users uncover the value, they can convert.

When to use it:

- If early funnel drop-off is high due to setup, form fields, or login gates
- When your product has a paywall but offers a freemium experience

Do:

- Design around the “aha moment” to show what makes your product great
- Pre-fill content, generate mock data, or simulate workflows to reduce friction
- Prompt signup or conversion when users engage with gated features/actions

Don’t:

- Drop users into a blank or confusing experience, guide with intentional prompts
- Under-deliver. Limited sandboxes can feel like bait-and-switch
- Delay CTAs too long. Surface sign ups/paywalls the peak moment of curiosity or value

Founder Tip:
Letting users explore before committing can lower perceived risk and build curiosity. A sandbox collapses time-to-value and raises confidence.

Make It Yours

What can users experience before we ask them to commit? Use these questions to design a sandbox that sparks curiosity and builds conversion momentum.

1. To reduce friction:

- What steps normally block early engagement (signup, setup, input)?
- Can we pre-fill or simulate value with dummy data or starter flows?
- Are we using this sandbox to remove fear or boost confidence?

2. To craft the “aha”:

- Which feature or moment delivers the quickest sense of value?
- Does the sandbox surface real benefits, not just placeholders?
- Are we guiding users to that outcome with prompts, not just access?

3. To convert:

- When and how should we nudge users to sign up?
- Can we add friction only when commitment signals are high?
- Does the CTA feel like an invitation to continue, not an interruption?

Shareability

Turn moments of pride into organic growth.

What it is:
Users voluntarily share achievements or outputs that elevate their perceived status, social, intellectual, professional, or aesthetic.

Why it works:
We share how something made us feel. When sharing is a flex, or a badge of honour, or something that simply elevates status, users naturally amplify your product.

When to use it:

- When users reach an achievement that would increase their status
- When your audience overlaps with identity-driven communities (runners, creators)
- In moments where the output (playlist, image, chart, profile) reflects user effort, taste, talent or skill

Do:

- Design stunning, lightly branded share visuals that feel native on socials
- Let users add a caption or quote make it feel theirs
- Anchor the share moment in emotion: pride, progress, surprise

Don't:

- Push share prompts before value is achieved
- Make the share feel too self-promotional
- Assume vanity is shallow it's often tied to meaning

Founder Tip:
This play works best when users feel achievement. Emotion is the real trigger. Build toward a moment of celebration users want to show off. Then let them share it.

Make It Yours

Make moments feel worth showing off. Use these prompts to trigger authentic virality without asking for it directly.

1. To earn the share:

- What progress, output, or achievement would feel share-worthy?
- Does it reflect something they're proud of like skill, taste, consistency?
- Are we tying the moment to status, identity, or surprise?

2. To package it:

- Are we making it visually beautiful and instantly share-worthy?
- Can users personalise it with captions, tone, or emojis?
- Does it feel like their win, not our marketing?

3. To time it right:

- Is this shown after a clear emotional high or moment of value?
- Are we linking share prompts to existing community behaviours (e.g. creators, runners, readers)?
- Could we build anticipation so the share moment feels like a natural outcome?

Referral

Turn users into advocates by designing invites right into the product flow.

What it is:
A self-perpetuating invite loop that encourages users to easily share or invite others, often with dual value incentives for both parties.

Why it works:
We trust friends. Referrals scale growth through social proof, not spend. When the product delivers value and users want to share your app, you grow exponentially.

When to use it:

- After users reach value (hit a milestone, share a file, join a challenge)
- In collaborative tools where inviting = value (teams, boards, docs)
- When user output benefits from network effects (e.g. playlists, workspaces)

Do:

- Build it seamlessly into the flow, “invite your team/friends” should feel native
- Offer relevant, clear incentives: extra storage, feature unlocks, discounts
- Shorten the viral cycle by prompting invites early, after success moments

Don’t:

- Stall until late in the flow, optimised cycle time matters
- Ask before the user gets value, it could feel like a chore
- Hide referral behind menus or complex steps

Founder Tip:
Referral is bottom-up marketing, it costs less, builds trust, and leverages users’ networks. If users love your app and feel proud, they’ll naturally share. Incentives help, but experience is the pitch. Bake in referral at peak emotional moments.

Make It Yours

How can we make sharing feel natural, rewarding, and frictionless? Use these questions to unlock growth from within.

1. To spark the moment:

- When does the user feel success, pride, or excitement?
- Are they creating content or value others would benefit from?
- Have they just finished a task or hit a milestone?

2. To make it easy:

- Can we pre-fill the invite or show who's already joined?
- Is the CTA baked into the flow ("invite your team")?
- Are invites just a tap away? no digging, no friction?

3. To make it rewarding:

- What's in it for both sender and receiver?
- Could we tie the offer to a feature unlock, discount, or status boost?
- Does the reward reinforce the product's core value?

4. To optimise timing:

- Is this shown after value is experienced?
- Are we prompting too late, when users have already dropped off?
- Are we tracking who refers and how fast those loops convert?

Variable Reward

Inject just the right amount of unpredictability to create return behaviour.

What it is:
The introduction of light unpredictability into a familiar flow, adding novelty to drive engagement.

Why it works:
Unpredictable is addictive. When users experience something slightly different each time, anticipation kicks in. It boosts dopamine and makes people come back.

When to use it:
- To reward exploration, inspire curiosity
- When your product's outputs are dynamic (AI, suggestions, discovery, content)
- To break monotony without changing structure (e.g. new visuals, tips, or bonuses)

Do:
- Make the randomness feel rewarding, not arbitrary
- Use in flows where outcomes aren't mission-critical
- Highlight differences visually (badges, colours, rare finds, rotating tips)

Don't:
- Add randomness where users expect control or reliability
- Hide important functionality behind randomness
- Create loops that feel addictive without purpose

Founder Tip:
A small variable twist can make users lean in. Keep them coming back and interact with the exciting content again.

Pair with: ***Micro Interactions*** | ***Intentional Friction*** | ***Referral*** | ***Intentional Friction*** | ***Curiosity*** | ***Discovery***

Make It Yours

Where can we inject just enough unpredictability to keep users coming back? Use these prompts to create moments worth returning for.

1. To find the right moment:

- Which core actions become repetitive over time?
- Where does exploration or play already exist in our flow?
- Do we have dynamic outputs (AI, suggestions, generated content)?

2. To design the loop:

- What could feel like a “prize” or surprise without needing high stakes?
- Could we frame randomness as delight (e.g., “What you might like next...”)?
- Can the result still feel useful even if it’s not always predictable?

3. To avoid manipulation:

- Are users gaining value, or just chasing novelty?
- Would this still work without the surprise factor?
- Can users opt out or skip if they’re not in the mood for randomness?

4. To make it memorable:

- Is the reward visual, emotional, or playful enough to feel meaningful?
- Could users talk about or share the outcome?
- Does it subtly reinforce a habit or behaviour we want to strengthen?

Small Quirk

Signature moments that turn utility into identity.

What it is:
A distinctive interaction, animation, UI flourish or pattern that adds personality to repeated product moments. Think of it as your product's accent, subtle but memorable

Why it works:
Users remember distinctive patterns. When done right, a small quirk becomes a signature increasing brand recall, delight, and perceived polish.

When to use it:

- On repeatable actions that anchor the product's core experience
- When you want to break out against competing products
- After clarity is nailed, and you want to layer personality without harming usability

Do:

- Tie the quirk to your product's brand, tone, or core philosophy
- Use it in moments that recur, so it becomes a familiar, ownable pattern or visual
- Keep it light, intuitive, and non-intrusive

Don't:

- Force quirk into high-stakes, high-friction UX (like checkout or account recovery)
- Prioritise novelty over clarity. Delight shouldn't require learning
- Break platform conventions without strong justification

Founder Tip:
Your app's quirk is a signature. When users recognise it as yours you've built something memorable. Own a small behaviour and you own a piece of the user's memory.

Make It Yours

What's one repeatable moment we could turn into a signature? Use these prompts to inject playful precision into your product.

1. To uncover the right moment:

- Where in the flow do users repeat an action often (e.g., swipe, search, tap)?
- What parts of our UX feel too generic or industry-standard?
- Have we already nailed clarity here, is it safe to add personality?

2. To shape the quirk:

- Can we tie this interaction to our brand tone or story?
- Is this a moment that happens often enough to become familiar?
- Will users intuitively "get it" without extra explanation?

3. To check the balance:

- Are we adding delight without risking confusion?
- Would this interaction still work if the user missed the flourish?
- Is it playful in low-stakes moments, not critical flows?

4. To make it ownable:

- Could this become something only our product does?
- How might we reuse this behaviour pattern across the app?
- Would a new user remember this after one try?

Fail Safe

Destructive actions are guarded with increased effort.

What it is:
Designing critical actions (like deletions, payments, submissions) with thoughtful friction or undo options so users can act confidently without the fear of irreversible mistakes.

Why it works:
It reduces anxiety, especially for new users, and encourages exploration. People are more likely to try new features when they know they can't break anything.

When to use it:

- For irreversible or high-stakes actions (delete account, send payment, submit form)
- When designing "danger zones" or admin panels
- Use clear, emotionally honest language (e.g. "This can't be undone")

Do:

- Add intentional friction to risky actions (confirmation, double-tap, hold-to-confirm)
- Offer soft-deletes, undo snackbars, or grace windows
- Provide contextual language that reinforces the risk ("This action can't be undone")
- Use progress saving or auto-draft saving

Don't:

- Let destructive actions fire with a single careless tap
- Hide risk behind familiar patterns
- Assume users understand the stakes, always clarify impact

Founder Tip:
Fail-safes are invisible trust signals. When users know they're safe, they act with confidence. Reduce support tickets and churn caused by accidental actions.

Make It Yours

How are we protecting users from permanent regret? Use these prompts to design with care, not just caution.

1. To identify risk points:

- What actions in our product are truly irreversible?
- Are there any “danger zones” users might stumble into too easily?
- Where are we seeing the most support tickets or accidental churn?

2. To reinforce thoughtful control:

- Do users understand why this action matters before committing?
- Are we using plain, direct language at the moment of risk?
- Could an “undo” action or soft delete be safer than a hard confirmation?

3. To reduce hesitation (not flow):

- Are we slowing users just enough to create clarity, not frustration?
- Can we add save states, drafts, or warnings to reduce decision pressure?
- Do users feel like they can explore safely without breaking anything?

4. To make confidence the default:

- Is the system communicating that they’re in control?
- Are we protecting users silently (auto-saving, contextual warnings)?
- Are destructive actions hidden behind misleading icons or gestures?

Limited Offer

Create urgency at moments of churn or hesitation.

What it is:
A time-sensitive incentive shown at critical moments. Skipping a paywall, abandoning onboarding, or deleting the app designed to re-engage with a last-chance opportunity.

Why it works:
Scarcity and urgency are timeless motivators. A well-timed offer taps into loss aversion: users feel like they're missing out by leaving now, so they reconsider.

When to use it:

- After a user skips or closes the paywall
- When uninstall intent is detected (e.g. long press > delete on iOS)
- On free trial expiry or renewal page
- Post cart abandonment or high-friction drop-off moments

Do:

- Make it feel timely, personal, and just-for-you
- Use expiry visuals (countdown, badge, banner) to anchor urgency
- Link the offer to past behaviour ("Since you tried...")

Don't:

- Repeat the same offer too often it loses power
- Use fake scarcity or misleading deadlines

Founder Tip:
A well-timed offer can make users re-consider. It's a great way to reduce churn and keep users around for longer.

Pair with: *The Paywall* | *Referral* | *Deep-link* | *Spark Curiosity* | *Time to Value*

Make It Yours

Don’t let the moment slip. Use these prompts to craft offers that feel personal, urgent, and well-timed.

1. To detect the right timing:

- What’s the last action that signals hesitation or drop-off?
- Are we detecting uninstall intent or skipped paywalls fast enough?
- When do users typically churn and can we intercept them earlier?

2. To make the offer resonate:

- What did the user explore or nearly complete that we can reference?
- Can we tailor the offer to their behaviour or plan tier?
- Does the offer feel personal, not broadcasted?

3. To build urgency with credibility:

- Are we using real countdowns or fake scarcity?
- Does the timer reset too often, losing trust?
- How can we reinforce this is a final window to act?
-

4. To reinforce value (not desperation):

- Are we framing the offer as a reward, not a bribe?
- Is the offer consistent with the value they’ve already seen?
- Does it feel like they’re missing out on progress, not just a discount?

5. To test and learn:

- What message performs best in these high-risk moments?
- Are we learning about price sensitivity or upgrade readiness?
- Can this offer double as feedback what does the user not take?

Discovery

Guide users to value before they know where to look.

What it is:
Surfacing helpful content, tools, or features before the user begins searching. It anticipates action and replaces decision paralysis with meaningful suggestions.

Why it works:
By highlighting what's possible, discovery reduces cognitive load and replaces "blank canvas anxiety" with curiosity. When users see what's possible, they explore, stay longer, and reach value faster.

When to use it:

- During onboarding or in early sessions when users don't know what's possible
- In search UIs, dashboards, or category pages
- When introducing new tools or features
- Anywhere users benefit from being demonstrated possibilities

Do:

- Use dynamic suggestions powered by user behaviour, trends or context
- Seed exploration with "Most popular," "You might like," or "People also used..."
- Show relevant queries before users type in search

Don't:

- Overwhelm with too many suggestions it becomes irrelevant noise
- Neglect users without introducing them through guided discovery

Founder Tip:
Discovery is a trust-building loop. The more helpful your suggestions are, the more users believe your product "gets them" making them likely to stay and explore deeper.

Pair with: ***Empty States,*** | ***Contact Bridge*** | ***Spark Curiosity*** | ***Time to Value*** | ***Referral*** | ***The Paywall***

Make It Yours

Don’t wait for users to search. Use these prompts to help your product suggest before it’s requested and turn curiosity into connection.

1. To identify the moment of need:

- Where are users most likely to feel unsure or stuck?
- Are there moments in the flow that feel like a dead end?
- When do users pause, hesitate, or bounce and why?

2. To design helpful suggestions:

- Could we suggest the next best action based on what they just did?
- What’s trending, popular, or proven that could seed exploration?
- Are we showing “what’s possible” or just “what’s available”?

3. To personalise discovery:

- What signals (e.g. scrolls, clicks, skips) are we using to tailor suggestions?
- Can we mirror behaviour (e.g. “Others who tried X also liked Y”)?
- Are we offering suggestions before users start typing?

4. To reduce cognitive load:

- Is our UI calm, scannable, and easy to act on?
- Are we overwhelming users with too many options or too much noise?
- Could we break suggestions into categories that reduce decision anxiety?

5. To keep discovery alive:

- Do suggestions evolve with user behaviour and trends?
- Are we highlighting new or timely content that sparks curiosity?
- Is discovery working like a loop or just a one-time nudge?

The Paywall

Turn a blocker into a craving and a conversion friction into desire.

What it is:
Great paywalls don't just restrict access, they amplify desire. By surfacing at the right moment, anchoring to value, and triggering emotion paywalls become invitations.

Why it works:
A well-timed paywall appears after users feel momentum, emotional investment, desire or clear benefit. When you lead with aspiration and timing, conversion becomes a reward, not a ransom.

When to use it:

- After a user completes a valuable action or hits a feel-good milestone
- Post-personalisation or setup: After investing effort when commitment signal is high

Do:

- Frame the upgrade as a logical next step that powers-up the experience
- Explain benefits, not just features. Lead with strong emotions and and benefits

Don't:

- Show the paywall before any value is experienced
- Use guilt-driven language
- Offer too many choices keep upgrade paths simple and decisive

Founder Tip:
Show users what they'll unlock, what they're about to lose, or what they've almost achieved. Desire builds when users feel progress, pride, and proximity to something just out of reach.

Pair with: ***Investment*** | ***Success Moments*** | ***Spark Curiosity*** | ***Time to Value*** | ***Limited Offer*** | ***Discovery***

Make It Yours

Build toward value. Use these prompts to make your paywall feel earned, exciting, and clear.

1. To decide the right moment:

- Has the user seen real value before the paywall appears?
- Did they just finish a streak, complete a goal, or unlock a benefit?
- What emotional peak can we pair with a conversion nudge?

2. To frame the offer with clarity:

- Are we explaining what users get, not just what they lose?
- Could we use reverse trial logic?
- Is the message rooted in benefits, not just features?

3. To highlight momentum:

- Can we reflect their journey so far (e.g. “You’ve created 5 designs”)?
- Does the copy reinforce a sense of achievement or progress?
- What would make this upgrade feel like levelling up not hitting a wall?

4. To avoid resistance:

- Are we using guilt-driven language that pressures instead of inspires?
- Are there too many upgrade options muddying the decision?
- Could we delay the paywall until it feels emotionally inevitable?

5. To measure effectiveness:

- Where in the flow are users most likely to convert?
- Which version of the paywall copy or layout performs best?
- How many users drop off vs. upgrade and why?

South China Morning Post

Investment

User input that deepens attachment and improves the product.

What it is:
A product pattern that asks users to input time, effort, or decisions like choosing preferences, saving data, or generating content. These acts of participation increase ownership. The more users invest, the more valuable the product feels.

Why it works:
We value what we shape. Every small contribution becomes a sunk cost that deepens emotional and cognitive commitment. This creates product gravity. It also sharpens the product's relevance, building stronger feedback loops.

When to use it:

- During onboarding, when users are forming habits and mental models
- When storing user data improves future recommendations or value
- To build a sense of progress before surfacing a paywall or locked feature

Do:

- Give users a reason to come back by connecting input to future reward
- Use stored actions to make the next visit easier, faster, or more delightful
- Highlight growing investment ("You've logged 9 entries," "Next unlock in 2 uploads")

Don't:

- Ask for input without context and benefits
- Let data disappear, visible investment creates attachment
- Interrupt the feedback loop by resetting progress or deleting effort

Founder Tip:
Users are loyal to what they've shaped. Every upload, setting, or saved item makes your product feel like their product. Leverage input not just for personalisation, but to power future triggers and stronger retention.

Pair with: ***Value Replay*** | ***The Paywall*** | ***Progressive Disclosure*** | ***Time to Value*** | ***Personalisation***

Make It Yours

People protect what they build. Use these prompts to design in-product actions that grow ownership, raise return potential, and deepen attachment.

1. Spot investment triggers

- What actions require time, effort, input, or decisions from the user?
- Are users asked to share preferences, create content, or upload data?
- Where do users leave behind emotional, social, or identity-based signals?

2. Turn effort into attachment

- What visible signs show the user what they've built so far?
- Could we auto-save, personalise, or preview based on their input?
- What would make this feel more like their space, not just the app?

3. Use progress to motivate return

- Do we give early signs of impact or reward (e.g. saved streaks, previews)?
- Is there a reason for users to return, to finish, improve, or protect progress?
- Could this input trigger smarter defaults or reminders next session?

4. Avoid invisible effort

- Are we asking users to contribute before they've seen value?
- Could input get lost or reset unexpectedly?
- Is there input friction with no emotional payoff?

5. Connect input to insight

- What types of user input improve product recommendations?
- How does stored effort (uploads, edits, favourites) sharpen UX or retention?
- Are we feeding that back to the user with clarity?

Gamified Progress

Game mechanics that trigger habit loops.

What it is:
Missions, milestones, or visual feedback which reward user actions and create a sense of forward motion. These structures mimic game loops for purposeful progress.

Why it works:
Progress is addictive. Even small wins build a sense of achievement, purpose, and momentum. Game-like systems trigger reward circuits and reinforce behaviour. The right loops keep users engaged and keep them coming back.

When to use it:
- Multi-step processes, habit-building features, onboarding, daily tasks
- When you want to increase stickiness with repeat use
- To break long tasks into motivating, bite-sized steps
- When your product has daily/weekly engagement

Do:
- Make the first few steps fast and achievable momentum early on matters most
- Use missions or quests to frame progress with purpose
- Add micro-rewards (sounds, animations, feedback) that support and feel earned

Don't:
- Force gamification into flows that don't benefit from it
- Use meaningless badges or empty point systems. Reward must feel relevant

Founder Tip:
Don't treat gamification as an add on. it's a behavioural engine, Use it to guide behaviour and build rituals. When building it, consider the B=MAP framework.

Make It Yours

Use these prompts to design habit loops, unlock progress, and drive return use.

1. Where does progress matter most?

- Are users completing a multi-step flow or setup?
- Are we asking them to build habits, track goals, or hit milestones?
- Where do users typically drop off and could progress nudge them to continue?

2. What does “winning” look like in your product?

- Can we define what success looks like for a session, day, or goal?
- Is there a repeatable loop we want users to complete?
- What are the early wins we can surface to build momentum?

3. How do we make progress feel visible and satisfying?

- Are we showing users how far they've come and what’s left?
- Are our cues (bars, steps, streaks) designed with emotion and clarity?
- Can we celebrate progress with micro-interactions, sounds, or animations?

4. Is our progress loop designed for return behaviour?

- Will users come back to maintain a streak or check off a goal?
- Could we surface daily challenges, quests, or evolving rewards?
- Are we creating urgency or curiosity to re-engage?

5. Are we reinforcing meaningful effort?

- Does progress align with outcomes the user cares about?
- Are rewards earned or just decorative?
- Are we building emotional investment with every checkmark?

Therapeutic journal
Did you know that writing just one sentence a day can improve your mood?
Keeping a journal only takes a few minutes a day, but its stress, creativity, and well-being benefits can last much longer.
How to do it
Wherever you want
Follow the instructions

Pattern Alignment

The familiarity of interactions, flows and behaviours understood by users.

What it is:
Interactions that use familiar patterns from other tools, apps, or platforms your users already use. Tap into their muscle memory so they instantly “get it” without needing to learn.

Why it works:
When your product reflects clear mental models, your app feels obvious, fast, and safe. Familiarity lowers the cognitive load, speeds up adoption, and builds confidence.

When to use it:

- When building out new interaction types or layouts
- For products targeting users switching from legacy systems or popular tools
- When digitalising an experience from other industries with set patterns

Do:

- Use platform conventions (e.g. swipes, tabs, gestures) where they make sense
- Prioritise speed-to-comprehension over novelty
- Borrow from familiar interfaces where expectations are already shaped

Don’t:

- Reinvent patterns just to be different
- Introduce friction where intuition should carry the user
- Mix too many models that cause confusion

Founder Tip:
You don’t need to train your user, leverage familiar patterns. Only invent new interactions in scenarios where differentiation is crucial and doesn’t obstruct usability.

Make It Yours

If users have to think, you've already lost. These prompts help you tap into what feels obvious, familiar, and intuitive.

1. To uncover user mental models:

- What similar products have shaped your users' expectations?
- How would a user expect this action, feature, or screen to behave?
- Are we asking users to unlearn something or reinforcing what they already know?

2. To reduce onboarding friction:

- Could we match known UI patterns from tools they already trust?
- Are our terms, icons, and flows familiar or forcing interpretation?
- What would make the first session feel instantly usable?

3. To decide when (and how) to break patterns:

- Are we breaking a mental model for a good reason or just to be different?
- Do users understand why we've chosen a new pattern or interaction?
- How can we clearly explain the value of doing things differently?

4. To align feedback and tone:

- Are our messages written in plain, goal-oriented language?
- Do we celebrate progress in a way that feels human, not robotic?
- Can users clearly see how their actions connect to their goals?

5. To test and validate:

- Where do users pause, hesitate, or tap the wrong thing?
- Which steps feel obvious and which create friction or drop-off?
- Are users describing the experience with words like "clear," "fast," or "intuitive"?
